

**ABSTRACT**

An improved organophotoreceptor includes an electrically conductive substrate and a photoconductive element on the electrically conductive substrate where the photoconductive element comprises:

5 a) a charge transport material having the following formula:

where X is a linking group;

10 Y<sub>1</sub> and Y<sub>2</sub> are, each independently, a phenothiazine group, a phenoxazine group, or a phenazine group;

R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, and R<sub>4</sub> are, each independently, an alkyl group, an alkenyl group, a heterocyclic group, or an aromatic group; and

R<sub>5</sub> and R<sub>6</sub> are, each independently, a hydrogen, an alkyl group, an alkenyl group, a heterocyclic group, or an aromatic group; and

15 (b) a charge generating compound.

Corresponding electrophotographic apparatuses and imaging methods are described.
